

# DOOSAN VERTI-LIGHTS

The standard lights on forklifts are designed to provide wide illumination in a horizontal area. When working outside that area, visibility is reduced, putting pressure on workers and making it more difficult to identify potential hazards. The Doosan Verti-lights provide the lighting for targeted illumination and safer working conditions when working in an area that requires a vertical perspective.

Doosan Verti-Lights have three settings for task-specific lighting:

**1 Driving (bottom banks of LEDs)**

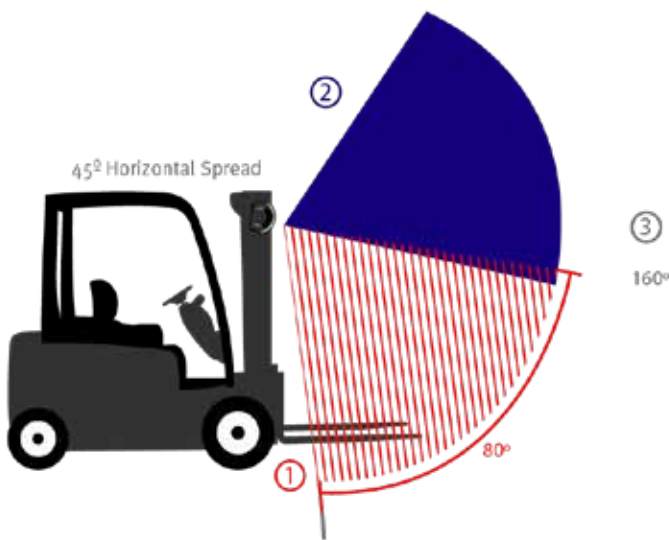

Additional visibility when driving. Light is focused forward and down—out of the eyes of oncoming workers and vehicles.

**2 High (top banks of LEDs)**

Forward overhead light. Vertical illumination allows operators to see potential hazards as equipment is being raised.

**3 Full (both banks of LEDs)**

A full beam of vertical light to fully illuminate work area. 1,600 Effective Lumens of bright, white LED light reduces strain on workers eyes.

## Features

- 12-110V DC Input  
Compact flush-mount design for mounting flexibility
- Three settings: driving, high and full
- 1,600 Effective Lumens when using full setting
- Rugged polycarbonate housing
- Integrated 3-pin Packard connector
